

How does **your** brain work?

If you are between the age of 18 and 85, have normal or corrected-to-normal vision, and do **NOT** have epilepsy or a family history of epilepsy, you may be able to participate in a behavioral study that uses transcranial magnetic stimulation (TMS).

Daniel Dilks, PhD, is conducting a study looking at how we use certain areas of our brain to recognize people, places, and things to help improve rehabilitation efforts when these abilities are lost, such as after a stroke or in developmental disorders.

- This study takes place at the Atlanta VA hospital and Emory University.
- It requires one to two visits lasting about 1.5 hours each.
- Participants will be compensated for their time.

If interested and for more details, call Dr. Dilks at:
404-727-8172 or 404-728-5064
